1 Live births by birth order in 1947-1959 were estimated from the distribution of total births (i.e., including stillbirths) by birth order using the method described in Appendix 2.

2 In 1954, the recorded number of live births with unknown age of the mother (313) is higher than the recorded number of all births (i.e., including stillbirths) with unknown age of the mother (280). The reason for this discrepancy is unknown.

3 Live births by birth order in 1947-1959 in the age group 19 and younger (-19) were redistributed into the age groups 12-14 and 15-19 using the method described in Appendix 3.
